MINERS GOLD

Over the centuries miners have used many methods to search for gold. One of the most popular methods is called panning. Using a shallow metal or plastic "gold pan" the miner washes gravel and sand from a stream bed in the flowing water in hopes of finding a few flakes of gold or perhaps even a small chunk called a nugget. This bottle contains a small amount of pure gold flakes (24 karat) similar to the bright beautiful gold which has excited miners for centuries.
