BOX OF TEETH

Fifty million years ago during Eocene Epoch, primitive mammals roamed the continents of Earth. The dinosaurs were extinct, but huge predators still ruled the sea. Little trace is left of these creatures, their soft body parts were eaten by other sea creatures and only their teeth and a few bones survived to become fossils. During that time long ago the area that is now the Sahara Desert was under water. It was home to giant sharks, skates, and rays. This Box of Teeth contains the fossilized teeth and other remains of these monsters of the ancient Sahara Sea.
